

Including covariates and seasonal effects in state-space time-series models

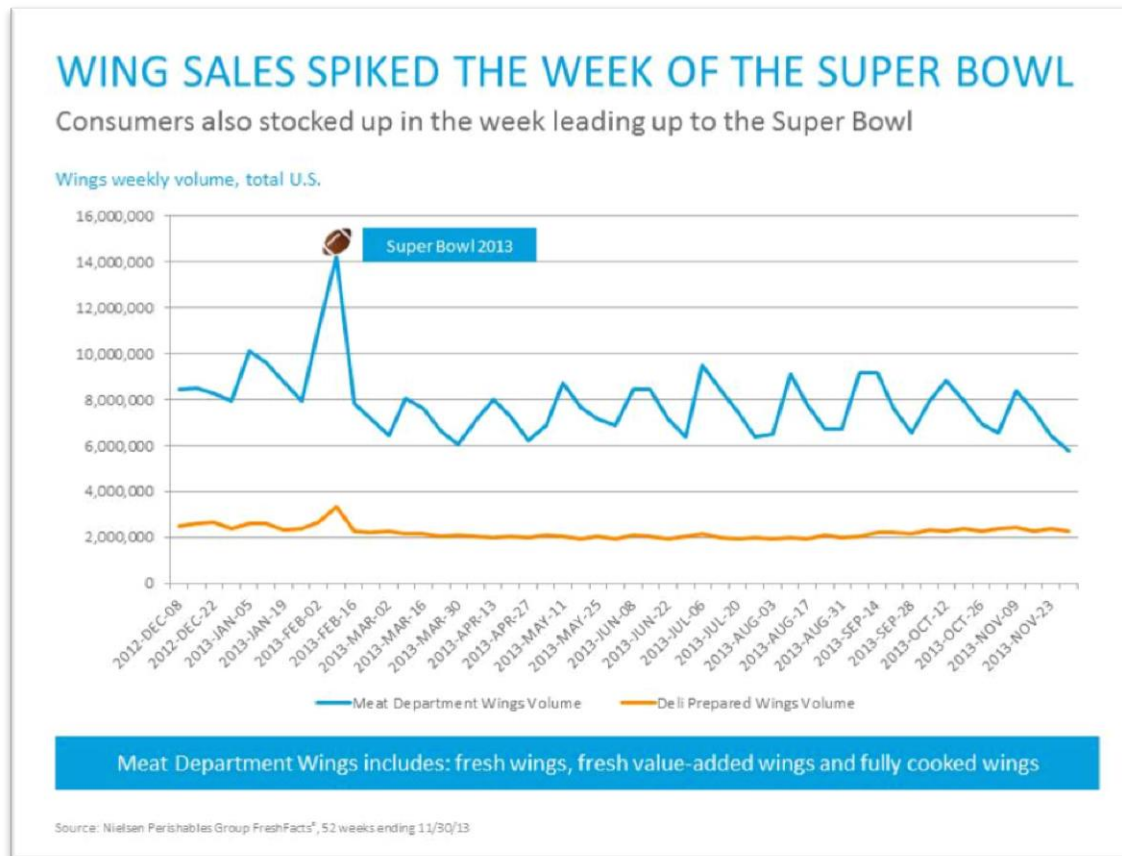

Eli Holmes

FISH 507 – Applied Time Series Analysis

24 January 2017

Why include covariates in a model?

- Most ecologists are interested in explaining observed patterns
- Covariates can explain the process that generated the patterns

Why include covariates in a model?

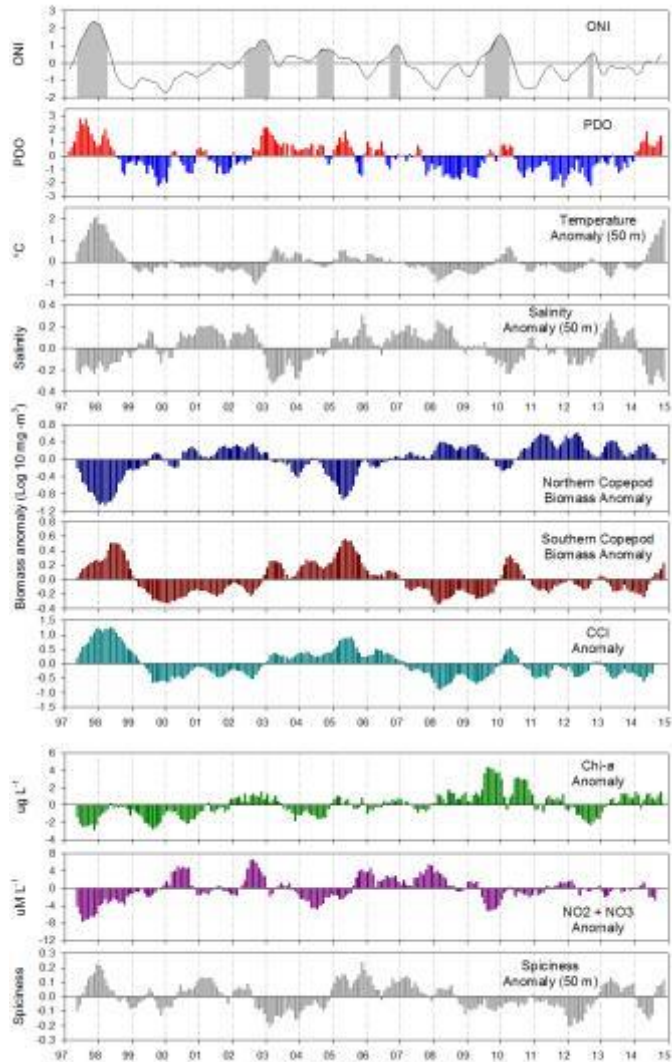

- You want to forecast something using covariates

The screenshot displays the Northwest Fisheries Science Center website. The header features the NOAA Fisheries logo and the text "Northwest Fisheries Science Center". A navigation menu includes links for Home, Research, Publications, News & Events, Multimedia, Education, About Us, and Contact. The main content area is titled "Forecast of Adult Returns for coho salmon and Chinook Salmon". A sidebar on the left lists "Ocean Ecosystem Indicators" with sub-links for Home, 2014 Indicator Summary, 2014 Salmon Forecast, and Ecosystem Indicators. A breadcrumb trail at the top of the main content area reads: Home | Research | Divisions | FE | Estuarine and Ocean Ecology | Ocean Ecosystem Indicators.

Covariates

Forecasts

	Juvenile Migration Year				Adult Return Outlook	
	2011	2012	2013	2014	Coho 2015	Chinook 2015
Large-scale ocean and atmospheric indicators						
PDO (May – Sept)	■	■	■	■	●	●
ONI (Jan-Jun)	■	■	■	■	●	●
Local and regional physical indicators						
Sea surface temperature anomalies	■	■	■	■	●	●
Coastal upwelling	■	■	■	■	●	●
Deep water temperature and salinity	■	■	■	■	●	●
Local biological indicators						
Copepod biodiversity	■	■	■	■	●	●
Northern copepod anomalies	■	■	■	■	●	●
Biological spring transition	■	■	■	■	●	●
Winter Ichthyoplankton	■	■	■	■	●	●
Juvenile Catch--June	■	■	■	■	--	●

Key

- good conditions for salmon
- good returns expected
- intermediate conditions for salmon
- no data
- poor conditions for salmon
- poor returns expected

Why include covariates in a model?

- You want to explain correlation in observation errors across sites or auto-correlation in time

Auto-correlated observation errors

Model your $v(t)$ as a
AR-1 process
ug. hard numerically

Or if know what is
causing the auto-
correlation, include that
as a covariate.

Correlated observation errors across sites (y rows)

Use a R matrix with off-
diagonal terms
ug, ug! hard numerically

Or if know what is
causing the correlation,
include that as a
covariate

Types of covariates

- Numerical
 - Continuous (eg, temperature, salinity)
 - Discrete (eg, counts)
- Categorical
 - Before/After
 - North/South
 - January, February, March, ...

Covariates occur in state, obs or both

State equation

$$\mathbf{x}_t = \mathbf{B}\mathbf{x}_t + \mathbf{u} + \mathbf{C}\mathbf{c}_t + \mathbf{w}_t \quad \mathbf{w}_t \sim \text{MVN}(0, \mathbf{Q})$$

(eg, nutrients affects growth, high temps kill)

Observation equation

$$\mathbf{y}_t = \mathbf{Z}\mathbf{x}_t + \mathbf{a} + \mathbf{D}\mathbf{d}_t + \mathbf{v}_t \quad \mathbf{v}_t \sim \text{MVN}(0, \mathbf{R})$$

(eg, vegetation obscures individuals,
temperature affect behavior making animals visible)

Covariates occur in state, obs or both

State equation

$$\mathbf{x}_t = \mathbf{B}\mathbf{x}_t + \mathbf{u} + \mathbf{C}\mathbf{c}_t + \mathbf{w}_t$$

k cols

$$\mathbf{w}_t \sim \text{MVN}(\mathbf{0}, \mathbf{Q})$$

m rows

$$\begin{bmatrix} \mathbf{C} \end{bmatrix}$$

*C is the effect of cov
on state*

1 col

$$\begin{bmatrix} \mathbf{c} \end{bmatrix}_t$$

k rows

*c(t) are the
covariates at time t*

m is number of states; *k* is number of covariates

Covariates occur in state, obs or both

Observation equation

$$\mathbf{y}_t = \mathbf{Z}\mathbf{x}_t + \mathbf{a} + \mathbf{D}\mathbf{d}_t + \mathbf{v}_t \quad \mathbf{v}_t \sim \text{MVN}(\mathbf{0}, \mathbf{R})$$

$$\mathbf{D} = \begin{matrix} \hat{e} & & \hat{u} \\ \hat{e} & k \text{ cols} & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \end{matrix}$$

n rows

D is the effect of cov on state

$$\mathbf{d}_t = \begin{matrix} \hat{e} & & \hat{u} \\ \hat{e} & 1 \text{ col} & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & & \hat{u} \end{matrix}$$

k rows

d(t) are the covariates at time t

n is number of obs; k is number of covariates

Covariate effects can differ or not

Different effects

$$\mathbf{C} = \begin{matrix} \hat{e} & & \hat{u} \\ \hat{e} & C_{P,1} & C_{N,1} & \hat{u} \\ \hat{e} & C_{P,2} & C_{N,2} & \hat{u} \\ \hat{e} & C_{P,3} & C_{N,3} & \hat{u} \end{matrix}$$

Same effect

$$\mathbf{C} = \begin{matrix} \hat{e} & & \hat{u} \\ \hat{e} & C_P & C_N & \hat{u} \\ \hat{e} & C_P & C_N & \hat{u} \\ \hat{e} & C_P & C_N & \hat{u} \end{matrix}$$

$$\mathbf{c}_t = \begin{matrix} \hat{e} & \text{Precipitation} & \hat{u} \\ \hat{e} & & \hat{u} \\ \hat{e} & \text{Nitrogen} & \hat{u}_t \end{matrix}$$

Covariates can be seasons or periods

State equation

$$\mathbf{x}_t = \mathbf{B}\mathbf{x}_t + \mathbf{u} + \mathbf{C}\mathbf{c}_t + \mathbf{w}_t \quad \mathbf{w}_t \sim \text{MVN}(\mathbf{0}, \mathbf{Q})$$

Observation equation

$$\mathbf{y}_t = \mathbf{Z}\mathbf{x}_t + \mathbf{a} + \mathbf{D}\mathbf{d}_t + \mathbf{v}_t \quad \mathbf{v}_t \sim \text{MVN}(\mathbf{0}, \mathbf{R})$$

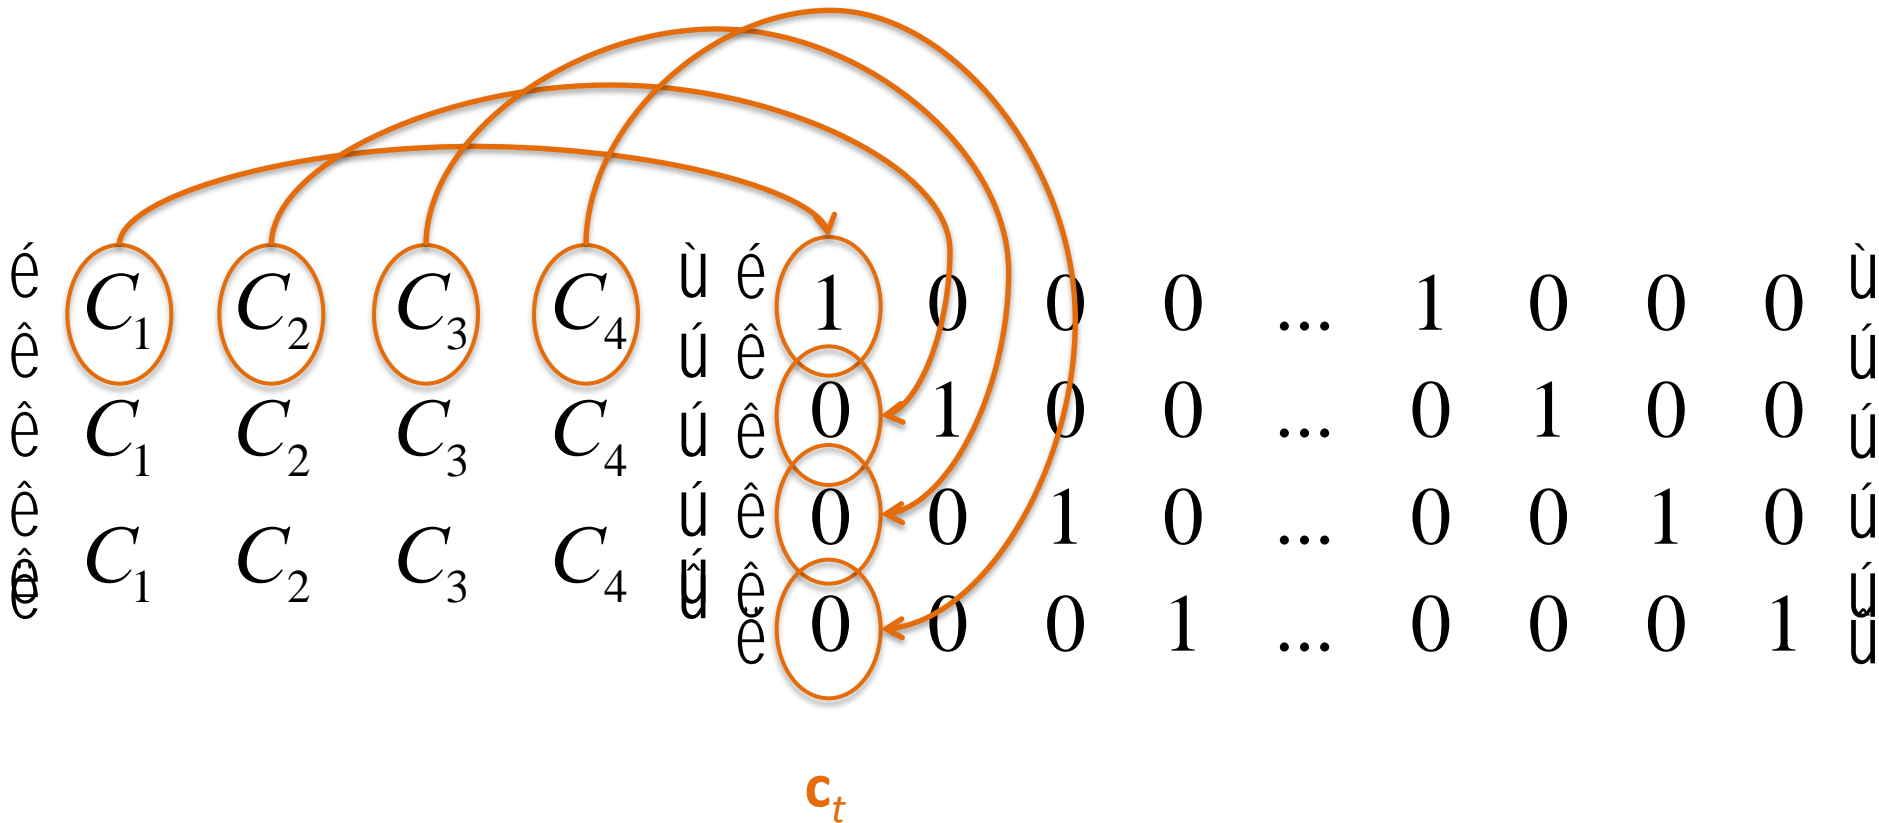

Seasonal or periodical effects

For example, effects of “season” on 3 states (3 rows)

	Winter	Spring	Summer	Autumn		Winter	Spring	Summer	Autumn		Winter	Spring	Summer	Autumn
C_1	C_2	C_3	C_4	\hat{C}_1	\hat{C}_2	1	0	0	0	...	1	0	0	0
C_1	C_2	C_3	C_4	\hat{C}_1	\hat{C}_2	0	1	0	0	...	0	1	0	0
C_1	C_2	C_3	C_4	\hat{C}_1	\hat{C}_2	0	0	1	0	...	0	0	1	0
				\hat{C}_1	\hat{C}_2	0	0	0	1	...	0	0	0	1
						t = 1	2	3	4				

Seasonal or periodical effects

For example, effects of “season” on 3 states

Seasonal or periodical effects

For example, effects of “season” on 3 states

Non-factor seasons or periods

Treating season as a factor means we have a parameter for each 'season'. 4 in the previous example. What if the factor were 'month'? Then we'd have 12 parameters!

- We can also estimate "season" via a nonlinear model
- Two common options:
 - 1) Cubic polynomial
 - 2) Fourier frequency

Season as a polynomial

$$\mathbf{x}_t = \mathbf{B}\mathbf{x}_t + \mathbf{u} + \mathbf{C}\mathbf{c}_t + \mathbf{w}_t \quad \mathbf{w}_t \sim \text{MVN}(\mathbf{0}, \mathbf{Q})$$

For months: $\mathbf{C}\mathbf{c}_t = b_1 m_t + b_2 m_t^2 + b_3 m_t^3$

$\begin{matrix} \hat{e} \\ \hat{e} \\ \hat{e} \\ \hat{e} \end{matrix}$	C_1	C_2	C_3	\hat{u}	\hat{e}	1	2	3	...	12	\hat{u}	m
	C_1	C_2	C_3	\hat{u}	\hat{e}	1	4	9	...	144	\hat{u}	m^2
	C_1	C_2	C_3	\hat{u}	\hat{e}	1	8	27	...	1728	\hat{u}	m^3
						\hat{e}	1	8	27	...	1728	\hat{u}
						$t = 1$	2	3			

Season as a Fourier series

- Fourier series are paired sets of sine and cosine waves
- They are commonly used in time series analysis in the frequency domain (which we will not cover here)

Season as a Fourier series

$$\mathbf{x}_t = \mathbf{B}\mathbf{x}_t + \mathbf{u} + \mathbf{C}\mathbf{c}_t + \mathbf{w}_t \quad \mathbf{w}_t \sim \text{MVN}(\mathbf{0}, \mathbf{Q})$$

Our new covariates at time t

$$\mathbf{C}\mathbf{c}_t = C_1 \sin(2\pi t/p) + C_2 \cos(2\pi t/p)$$

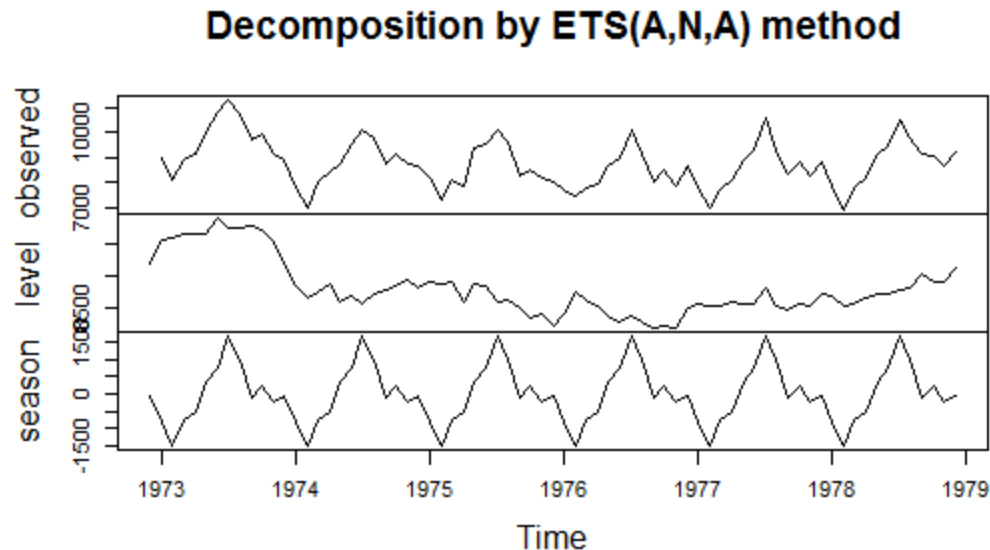

$$\begin{matrix} \hat{c}_1 \\ \hat{c}_2 \\ \hat{c}_3 \\ \hat{c}_t \end{matrix} \begin{matrix} C_1 & C_2 \\ C_1 & C_2 \\ C_1 & C_2 \\ C_1 & C_2 \end{matrix} \begin{matrix} \hat{u}_1 \\ \hat{u}_2 \\ \hat{u}_3 \\ \hat{u}_t \end{matrix} \begin{bmatrix} \sin\left(\frac{2\pi t}{p}\right) \\ \cos\left(\frac{2\pi t}{p}\right) \end{bmatrix}_t$$

t is time step (1, 2, 3, ..., number of data points)

p is period (e.g., 12 months per year so $p=12$)

Feb 7th Forecasting with Exponential Smoothing Models

- We'll talk about modeling time-varying seasonal effects at that time.
- Exponential smoothing models are related to Dynamic Linear Models, which Mark will cover in Week 5

Dealing with missing covariates**

- Drop years / shorten time series to remove missing values
- Interpolate missing values
- Develop process model for the covariates
 - Allows us to incorporate observation error into the covariates (known or unknown)
 - Allows us to interpolate but NOT treat that interpolated value as known. It is an estimated value that has uncertainty.

Dealing with missing covariates**

$$\begin{bmatrix} \mathbf{x}^{(v)} \\ \mathbf{x}^{(c)} \end{bmatrix}_t = \begin{bmatrix} \mathbf{B}^{(v)} & \mathbf{C} \\ \mathbf{0} & \mathbf{B}^{(c)} \end{bmatrix} \begin{bmatrix} \mathbf{x}^{(v)} \\ \mathbf{x}^{(c)} \end{bmatrix}_{t-1} + \begin{bmatrix} \mathbf{u}^{(v)} \\ \mathbf{u}^{(c)} \end{bmatrix} + \mathbf{w}_t,$$

$$\mathbf{w}_t \sim \text{MVN} \left(\mathbf{0}, \begin{bmatrix} \mathbf{Q}^{(v)} & \mathbf{0} \\ \mathbf{0} & \mathbf{Q}^{(c)} \end{bmatrix} \right)$$

$$\begin{bmatrix} \mathbf{y}^{(v)} \\ \mathbf{y}^{(c)} \end{bmatrix}_t = \begin{bmatrix} \mathbf{Z}^{(v)} & \mathbf{D} \\ \mathbf{0} & \mathbf{Z}^{(c)} \end{bmatrix} \begin{bmatrix} \mathbf{x}^{(v)} \\ \mathbf{x}^{(c)} \end{bmatrix}_t + \begin{bmatrix} \mathbf{a}^{(v)} \\ \mathbf{a}^{(c)} \end{bmatrix} + \mathbf{v}_t,$$

$$\mathbf{v}_t \sim \text{MVN} \left(\mathbf{0}, \begin{bmatrix} \mathbf{R}^{(v)} & \mathbf{0} \\ \mathbf{0} & \mathbf{R}^{(c)} \end{bmatrix} \right)$$

(v) are the variates (data)

(c) are the covariates

Dealing with missing covariates**

$$\mathbf{x}_t = \mathbf{B}\mathbf{x}_{t-1} + \mathbf{u} + \mathbf{w}_t, \text{ where } \mathbf{w}_t \sim \text{MVN}(0, \mathbf{Q})$$

$$\mathbf{y}_t = \mathbf{Z}\mathbf{x}_t + \mathbf{a} + \mathbf{v}_t, \text{ where } \mathbf{v}_t \sim \text{MVN}(0, \mathbf{R})$$

$$\mathbf{x} = \begin{bmatrix} \mathbf{x}^{(v)} \\ \mathbf{x}^{(c)} \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} \mathbf{B}^{(v)} & \mathbf{C} \\ 0 & \mathbf{B}^{(c)} \end{bmatrix} \quad \mathbf{u} = \begin{bmatrix} \mathbf{u}^{(v)} \\ \mathbf{u}^{(c)} \end{bmatrix} \quad \mathbf{Q} = \begin{bmatrix} \mathbf{Q}^{(v)} & 0 \\ 0 & \mathbf{Q}^{(c)} \end{bmatrix}$$
$$\mathbf{y} = \begin{bmatrix} \mathbf{y}^{(v)} \\ \mathbf{y}^{(c)} \end{bmatrix} \quad \mathbf{Z} = \begin{bmatrix} \mathbf{Z}^{(v)} & \mathbf{D} \\ 0 & \mathbf{Z}^{(c)} \end{bmatrix} \quad \mathbf{a} = \begin{bmatrix} \mathbf{a}^{(v)} \\ \mathbf{a}^{(c)} \end{bmatrix} \quad \mathbf{R} = \begin{bmatrix} \mathbf{R}^{(v)} & 0 \\ 0 & \mathbf{R}^{(c)} \end{bmatrix}$$

See Holmes, Ward and Scheuerell (2014) “MARSS User Guide” for a discussion and example of how to do this.

Topics for the computer lab

- Fitting multivariate state-space models
Fitting multivariate state-space models
with covariates
 - Seasonal effects
